

E-commerce Sales Analysis Report

1. Project Overview

Objective

The objective of this project was to analyze sales data from an e-commerce company in order to identify sales trends, best-performing products, customer behavior, and key business insights.

Tools Used

- MySQL
- SQL
- Python (Pandas, Matplotlib)
- Power BI

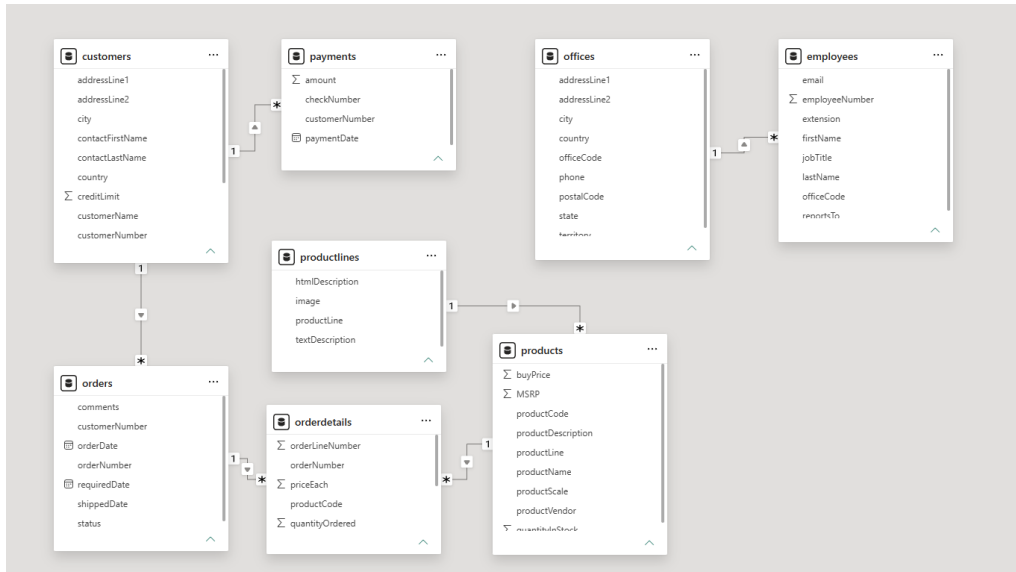

Dataset

The analysis was performed using the Classic Models database containing information about:

- customers,
- orders,
- order details,
- products,
- product categories,
- payments.

2. Data Preparation

The database was imported into MySQL and queried using SQL. The required tables were joined and transformed for analysis. Additional visualizations were created using Python, while an interactive dashboard was developed in Microsoft Power BI.

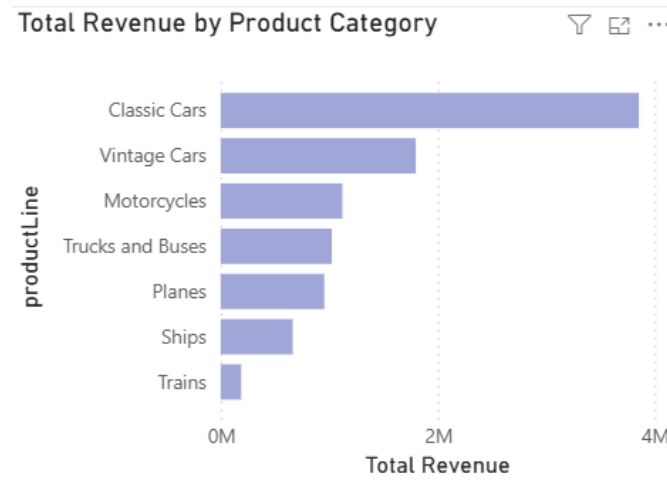

3. Business Questions

- Which product categories generated the highest revenue?
- Which products generated the most revenue?
- Who are the most valuable customers?
- How does revenue change over time?
- What percentage of orders has each status?
- Which countries generate the highest sales?

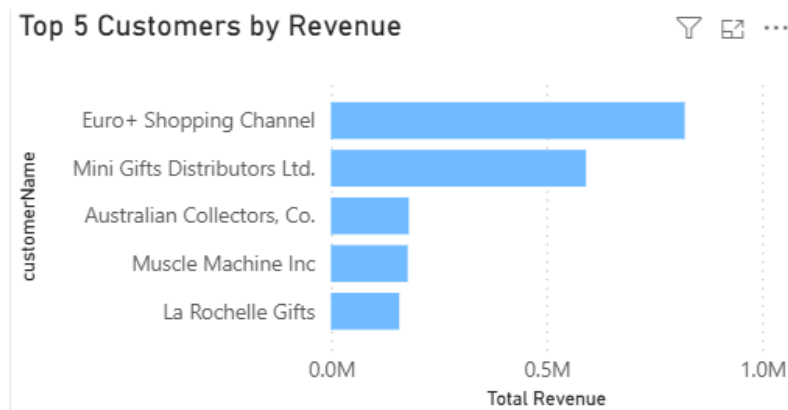

4. Results

Revenue by Product Category

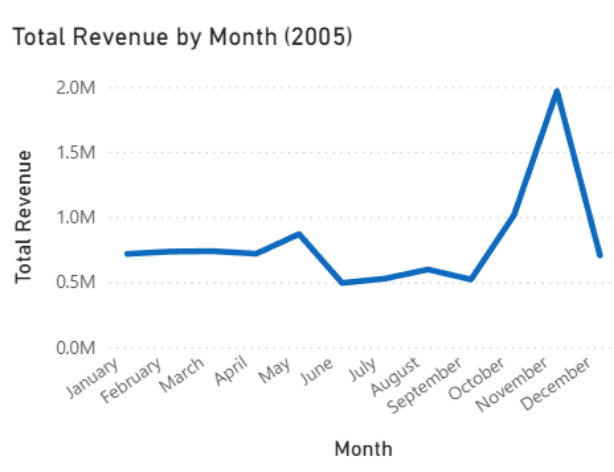

Classic Cars generated the highest revenue among all product categories, significantly outperforming Vintage Cars and Motorcycles.

Top Customers

Euro+ Shopping Channel and Mini Gifts Distributors Ltd. made the biggest revenue (around 15%), indicating that maintaining relationships with key customers is important.

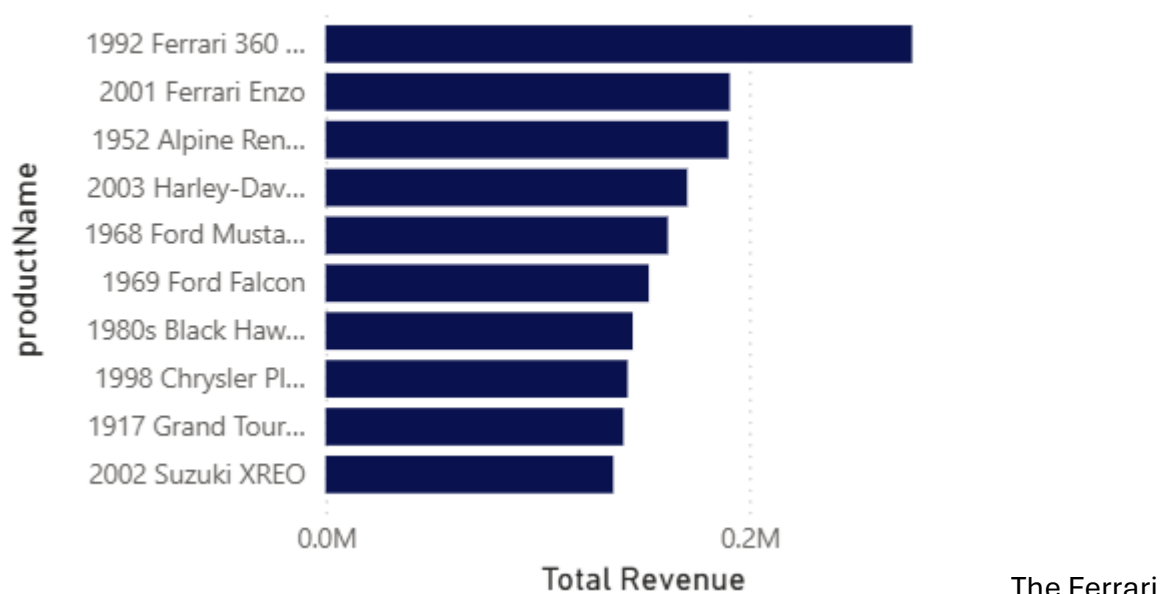

Total Revenue in 2005

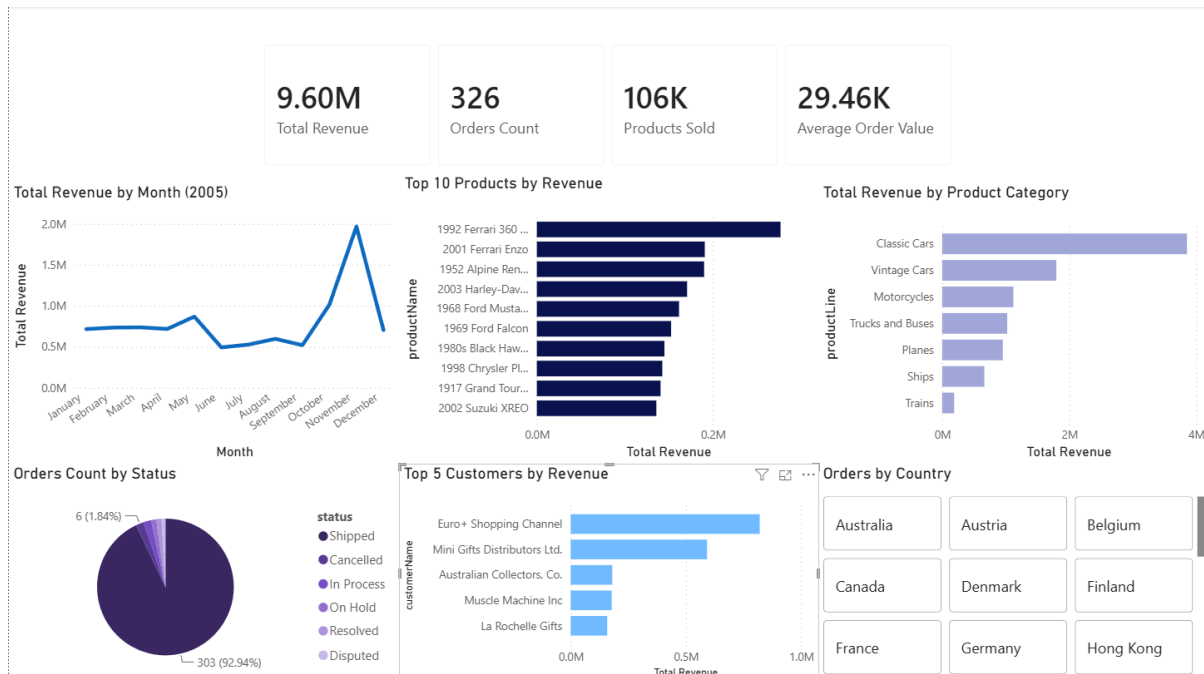

Revenue remained relatively stable throughout the year, with a significant increase during November.

Top Products

Top 10 Products by Revenue

5. Dashboard

An interactive dashboard was developed in Microsoft Power BI. It enables users to analyze revenue, orders, products, customers and categories using interactive filters.

6. Conclusions

The analysis identified the company's best-selling products, highest-value customers and strongest product categories. The dashboard allows users to quickly explore sales performance and supports business decision-making.
